

Store operations, from sale to close

A practical guide for employees and super administrators

EDITION	SYSTEM	PRODUCTION ACCESS
Version 1.0 • July 2026	FlashPOS web application	pos-flashexpress- production.up.railway.app

Inventory made simple. Sales made visible.

How to use this manual

Use the quick-start steps first, then refer to the section for the task you are performing.

Fastest way to begin

Sign in, confirm your name and role, check the Dashboard, then open Point of Sale to record your first transaction.

Contents

SECTION	TOPIC	USE IT FOR
1	Access and roles	Sign-in, permissions, security
2	Dashboard	Sales, channels, products, payments, stock
3	Point of Sale	Walk-in and marketplace transactions
4	Transactions	Receipts, fulfillment, refunds
5	Inventory	Products, units, stock adjustments
6	Purchases	Suppliers, purchase orders, receiving
7	Reports	Sales periods, profitability, exports
8	Daily closing	Cash and GCash reconciliation
9	Expenses and tax	Operating costs and 3% charge
10	Administration	Users, activity log, tools
11	Operating routines	Opening, selling, end-of-day
12	Troubleshooting	Common issues and corrections

Key terms

TERM	MEANING
Piece	The smallest stock quantity the system tracks and deducts.
Box	A sellable unit containing the configured number of pieces.
On hand	Current available stock, stored as pieces and shown as boxes plus loose pieces.
Channel	Where the order came from: Walk-in, TikTok, Lazada, or Shopee.
Net sales	Completed sales after refunds; shown separately from collected percentage tax.
Variance	Actual payment counted minus the amount expected by FlashPOS.

1. Access and roles

FlashPOS uses individual accounts so every important action can be attributed to the person who performed it.

Sign in

1. Open the production web address in a current browser. For local use, open `http://localhost:3000`.
2. Enter the email address and password issued by the super administrator.
3. Select Sign in to FlashPOS. After authentication, the Dashboard opens.
4. Confirm that your name and role appear at the lower-left of the navigation panel.

No public registration
Users cannot create their own accounts from the login page. A super administrator creates each employee account.

Role permissions

CAPABILITY	EMPLOYEE	SUPER ADMIN
Create sales and print receipts	Yes	Yes
Add/edit products and adjust stock	Yes	Yes
Archive or permanently delete products	No	Yes
View purchase orders and receive stock	Yes	Yes
Create suppliers and purchase orders	No	Yes
Issue item refunds and restock returns	No	Yes
View full profit and expense information	Limited	Yes
Manage users, settings, tools, and activity log	No	Yes

Account safety

- Use a separate account for every employee; do not share one cashier login.
- Never send passwords or Supabase secret keys through chat or public messages.
- Select Sign out when leaving the terminal, especially on a shared computer.
- Ask a super administrator to deactivate an account immediately when access is no longer required.

2. Dashboard

The Dashboard is the store's at-a-glance control center. It summarizes sales performance and highlights stock that needs attention.

AREA	WHAT IT TELLS YOU	HOW TO USE IT
Today's sales	Sales value recorded today	Compare with current order volume and closing expectations.
Average order	Average transaction value	Watch whether customers are buying more per order.
Best seller	Top product for the recent period	Prioritize replenishment and promotions.
Top channel	Leading source among Walk-in, TikTok, Lazada, Shopee	Plan staffing and marketplace stock.
7-day sales graph	Daily sales trend	Spot busy days, slow days, and unusual changes.
Channel performance	Revenue by order source	Compare marketplace and walk-in contribution.
Payment mix	Cash and GCash distribution	Support end-of-day payment verification.
Stock attention	Low-stock products	Open Inventory and replenish or adjust them.
Recent sales	Latest transactions	Quickly verify that orders were recorded.

Interpret trends carefully

A chart reflects only transactions recorded in FlashPOS. Missing sales, incorrect dates, or refunds will change the totals.

Recommended dashboard check

- At opening: review Stock attention and unresolved marketplace orders.
- During the day: watch Today's sales and Recent sales for missing transactions.
- Before closing: compare Payment mix with cash and verified GCash activity.

3. Point of Sale

Use Point of Sale for every walk-in, TikTok, Lazada, and Shopee order so stock, reports, and closing totals remain accurate.

Create a sale

1. Open Point of Sale from the navigation panel.
2. Choose the order source: Walk-in, TikTok, Lazada, or Shopee.
3. Search by product name, SKU, or barcode, then select the required piece or box option.

4. Enter the quantity. Review the cart and confirm that enough stock is available.
5. For Walk-in, choose Cash or GCash. For GCash, enter the transaction reference ID.
6. For TikTok, Lazada, or Shopee, enter the marketplace order ID shown on the platform.
7. Review subtotal, the automatic 3% non-VAT percentage charge, and the final total.
8. Complete the sale, then print or save the receipt if needed.

Source and payment requirements

ORDER SOURCE	PAYMENT / REFERENCE	OPERATIONAL NOTE
Walk-in — Cash	No electronic reference	Count the payment in the cash drawer.
Walk-in — GCash	GCash reference ID required	Verify the reference before completing the sale.
TikTok	TikTok order ID required	Use the same ID as the marketplace order.
Lazada	Lazada order ID required	Use the same ID as the marketplace order.
Shopee	Shopee order ID required	Use the same ID as the marketplace order.

How the 3% charge is calculated

CALCULATION	EXAMPLE
Subtotal	₱1,000.00
3% percentage charge	₱30.00
Customer total	₱1,030.00

Duplicate references are blocked
If a GCash reference or marketplace order ID has already been used, verify the order before trying again. Do not invent a replacement reference.

Stock is automatic
Completing a sale deducts the equivalent number of pieces. One box deducts the product's configured pieces-per-box quantity.

4. Transactions and receipts

Transactions is the permanent operational history of sales, fulfillment updates, receipts, and authorized refunds.

Find and review a transaction

1. Open Transactions and locate the sale by receipt number, date, channel, or customer/order reference.
2. Open the transaction to review items, quantities, source, payment, percentage charge, and total.
3. Use Print receipt to print a paper copy or choose Save as PDF in the browser print dialog.

Marketplace fulfillment

Update the order as it moves through the marketplace workflow. Typical statuses are Pending, Packed, Shipped, Delivered, and Completed. Status changes do not create a new sale; they document fulfillment of the existing order.

Refund items — super administrator

1. Open the original transaction and select the item refund action.
2. Enter the quantity being refunded and a clear reason.
3. Choose whether returned goods should be restocked. Restock only products that are physically sellable and returned to inventory.
4. Confirm the refund. FlashPOS reduces net sales and returns the related portion of the percentage charge.

Refund control
Never delete or manually alter stock to imitate a refund. Use the refund feature so the sale, tax, stock movement, and activity log remain connected.

Receipt numbering

Use the FlashPOS receipt number when reconciling an order, responding to a buyer, or investigating a discrepancy. Marketplace IDs and GCash references support verification but do not replace the internal receipt number.

5. Inventory

Inventory tracks each product in pieces while allowing sales and stock adjustments in either pieces or boxes.

Add a product

1. Open Inventory and select Add product.
2. Enter product name, unique SKU, category, and optional barcode.
3. Enter cost per piece and piece selling price.
4. If sold by box, enter pieces per box and the box selling price. If it is not sold by box, set pieces per box to 1.
5. Enter opening boxes and loose pieces, then set the low-stock alert level.
6. Save and verify that the product appears with the correct on-hand quantity.

Adjust stock

MODE	USE WHEN	EXAMPLE
------	----------	---------

Add	Stock physically arrived outside a purchase receipt or a correction is needed	+2 boxes after verified delivery
Remove	Damage, expiry, loss, or another non-sale reduction occurred	-5 pieces damaged
Set exact	A complete physical count has established the true quantity	Set to 8 boxes and 3 pieces

Select Pieces or Boxes, enter the quantity, and provide a meaningful reason. The adjustment creates a stock movement and an activity record.

Edit, archive, or delete

ACTION	RESULT	BEST USE
Edit	Changes product details and selling units	Correct names, pricing, barcode, or thresholds.
Archive	Hides a product from normal active use while preserving history	Discontinued products with past transactions.
Delete	Permanently removes an eligible product	Incorrect test products with no required history; super admin only.

Count before correcting

Use Set exact only after a physical count. Record the reason in plain language, such as “Physical count 21 Jul 2026,” so the change can be audited.

6. Purchases and receiving

Purchasing records expected inventory and increases stock only when quantities are actually received.

Super administrator setup

1. Create the supplier with name and optional contact, phone, email, and address.
2. Create a purchase order, select the supplier, and add product lines in pieces with their cost per piece.
3. Add a supplier reference and notes when available, then save the purchase order.

Receive stock

1. Open Purchases and select the relevant purchase order.
2. Compare the delivery against each purchase-order line.
3. Enter only the quantity physically received. Partial receipts are allowed.
4. Confirm receipt. FlashPOS increases inventory and records the receiving activity.
5. Repeat later for any remaining quantity until the order is fully received.

Avoid duplicate stock
Do not also use an Add stock adjustment for items received through a purchase order. Receiving already increases inventory.

Receiving controls

CHECK	WHY IT MATTERS
Correct supplier and PO	Keeps purchase history and vendor totals accurate.
Correct product and quantity	Prevents overstatement or understatement of stock.
Correct cost per piece	Supports more reliable cost and income reporting.
Delivery condition	Damaged items should not be received as sellable stock.

7. Reports, printing, and exports

Reports turn recorded transactions into operational and financial summaries. Choose the period that matches the question you need to answer.

Available sales periods

PERIOD	COMMON USE
Today	Current-day monitoring and cashier verification
Last 7 days	Short-term trend, best seller, and channel comparison
Last 30 days	Rolling performance and replenishment planning
Selected month	Monthly sales, expenses, tax, and income review

Main report measures

MEASURE	DEFINITION
Net sales	Recorded sales after refunds, excluding the separately displayed percentage tax.
Transactions	Count of sales in the selected period.
Average order	Net sales divided by transaction count.
Pieces sold	Product quantity converted to the base piece unit.
Top products	Products ranked by quantity or sales contribution.
Channel / payment / cashier	Breakdowns used to compare where and how sales were processed.
Income summary	Sales less product cost and operating expenses; visible to super administrators.

Print a report

1. Open Reports or System settings and tools.
2. Select Today, 7 days, 30 days, or a specific month.
3. Choose the sales or inventory print option.
4. In the browser dialog, select a printer or Save as PDF. Review paper size, orientation, margins, and preview before printing.

Export data

System settings provides CSV exports for sales, inventory, expenses, purchases, cashier closings, and the activity log. CSV files can be opened in Excel or Google Sheets for additional analysis.

CSV privacy

Exports may contain staff names, transaction references, costs, and operational history. Store them in a restricted folder and avoid sharing them publicly.

8. Daily closing

Daily closing compares what FlashPOS expects with what the cashier actually counted. It identifies shortages, overages, or missing records.

What the figures mean

FIELD	MEANING
Expected cash	Today's recorded walk-in cash payments for the signed-in cashier.
Expected GCash	Today's recorded and verified walk-in GCash payments for the signed-in cashier.
Actual cash	Cash physically counted in the drawer for the applicable sales.
Actual GCash	Total verified in the GCash merchant/account history.
Variance	Actual amount minus expected amount. Zero means the records match.

Close the cashier day

1. Stop processing sales for the cashier being closed.
2. Count the applicable cash carefully and verify the day's GCash references.
3. Open Daily closing and compare Expected cash and Expected GCash.
4. Enter Actual cash and Actual GCash.
5. If a variance exists, investigate receipts, duplicate/missing sales, change, and GCash references.
6. Enter closing notes explaining any unresolved shortage, overage, or verification detail.

7. Select Close cashier day. Each cashier can close the day once; the result appears in Closing history.

Example variance

Expected cash ₱5,000; actual cash ₱4,950; variance –₱50. The note should explain the investigation or unresolved shortage.

Scope

Daily closing currently reconciles walk-in Cash and GCash. TikTok, Lazada, and Shopee settlements should be checked against their marketplace statements separately.

9. Expenses, income, and percentage tax

The Expenses workspace records actual operating costs by date and supports monthly income review for super administrators.

Record an expense

1. Open Expenses and select the month you want to review.
2. Select Add expense, enter the actual date, category, amount, and a useful note.
3. Save the entry and confirm it appears in Expense entries and Category totals.
4. Use Edit to correct an entry. Delete only duplicate or invalid records.

Expense categories

CATEGORY	EXAMPLES
Electricity	Actual electricity bill or meter-related charge
Manpower labor	Wages, salaries, or contract labor
Packaging materials	Bags, tape, cartons, bubble wrap, labels
Rent	Shop, stall, warehouse, or storage rent
Percentage-tax payment	Actual tax payment made for the period
Gas delivery	Fuel or delivery transport expense
Other	A valid operating cost not covered above; explain it in Notes

3% non-VAT percentage charge

FlashPOS automatically adds the configured 3% charge to every new transaction and displays it separately from sales. The Expenses page shows the amount collected for the selected month. When the business actually pays the tax, record that payment under Percentage-tax payment; do not record the collected estimate as an expense before payment unless that matches your accounting policy.

MONTHLY VIEW	BASIC INTERPRETATION
Net sales	Sales after refunds, before operating expenses

Gross profit	Net sales less the recorded product cost
Operating expenses	Total actual expense entries for the selected month
Estimated operating income	Gross profit less operating expenses
Percentage tax collected	Charge collected from customers and tracked separately

Accounting notice

FlashPOS is an operational record, not a tax filing service. Confirm the correct tax base, classification, deductions, and filing treatment with your accountant or the appropriate tax authority.

10. Administration and system tools

Super administrators maintain access, review accountability, and use store-wide print and export tools.

Team and access

1. Open Team & access and create a user with name, email, temporary password, and role.
2. Assign Employee for normal operations or Super Admin only when full system control is required.
3. Tell the user to sign in and replace any shared temporary credentials according to store policy.
4. Deactivate users who should no longer access the store. Reactivate only after authorization.

Activity log

Activity log shows the latest recorded system actions, including the user, action type, affected record, details, and time. Use it to investigate stock changes, product edits, refunds, expenses, and administrative actions. The log is an audit record; do not treat it as a place to edit transactions.

System settings and tools

TOOL	PURPOSE
Sales report printing	Print Today, 7-day, 30-day, or selected-month sales.
Inventory printing	Produce an on-hand and stock-status list.
CSV exports	Export sales, inventory, expenses, purchases, closings, or activity.
Store health summary	Review important configuration and operating indicators.
Shortcuts	Open common administration and reporting pages quickly.

Least privilege

Keep the number of super administrators small. Employees should receive only the access they need for their role.

11. Standard operating routines

Consistent routines make the reports trustworthy and reduce stock and payment discrepancies.

Opening checklist

- Sign in with your own account and confirm the correct user name and role.
- Check that System online appears and open the Dashboard.
- Review Stock attention and urgently needed purchase receipts.
- Confirm that the cash drawer and GCash device/account are ready.
- Review pending marketplace orders before accepting new fulfillment work.

During the day

- Record every order once, using the correct source and reference.
- Print or save receipts when required and keep the receipt number for inquiries.
- Receive purchase stock only after physically checking it.
- Record damage, expiry, and corrections as stock adjustments with clear reasons.
- Record actual expenses on their real dates and retain supporting documents.
- Update marketplace fulfillment statuses as orders progress.

End-of-day checklist

- Review Recent sales and compare marketplace orders with TikTok, Lazada, and Shopee.
- Verify GCash references and count the applicable cash.
- Complete Daily closing and explain any variance.
- Review low stock and prepare purchase orders or replenishment notes.
- Sign out of FlashPOS and secure printed reports and exported files.

One source of truth

Do not maintain a second unofficial sales total that bypasses FlashPOS. If a correction is needed, use the corresponding transaction, refund, expense, purchase, or stock function.

12. Troubleshooting and support

Use these checks before changing data. If the issue remains, capture the exact error message, time, page, and receipt or product reference.

ISSUE	CHECKS AND ACTION
Cannot sign in	Confirm email/password, internet access, and that the account is active. Ask a super admin to verify the user.
Product does not appear in POS	Confirm it is active, has a selling unit and price, and is not archived. Check stock if out-of-stock items are restricted.

Not enough stock	Verify the requested piece/box quantity, review stock movements, and perform a physical count before adjusting.
Duplicate GCash or marketplace ID	Search Transactions for the reference. Confirm whether the order was already recorded.
Stock total is wrong	Review sales, refunds, receipts, and stock movements; then use Set exact only after a physical count.
Report shows zero or wrong month	Confirm the selected period and transaction dates. Check whether refunds changed net sales.
Cash/GCash variance	Compare receipts, payment methods, change, GCash references, and missing or duplicate transactions.
Print layout is incorrect	Use print preview, correct paper size/orientation, set reasonable margins, and disable unwanted browser headers.
Application unavailable	Refresh once, check internet access, then ask the administrator to review Railway deployment/runtime logs.
Feature says migration required	A super administrator must run the specified SQL migration in the connected Supabase project, then refresh.

Information to provide when asking for help

- Your name and role, without sharing your password.
- The page and action being performed.
- Exact error message and a screenshot with secret keys hidden.
- Receipt number, product SKU, purchase order, or date range involved.
- Whether the issue occurs locally, on the Railway production site, or both.

Protect secrets
Never include Supabase secret keys, passwords, or private environment-variable values in a screenshot or support message.

Document control

ITEM	VALUE
Document	FlashPOS User Manual
Edition	Version 1.0 — July 2026
Audience	Employees and super administrators
Update trigger	Revise after a workflow, role, tax, or reporting feature changes
